PROFESSIONAL SUMMARY

Final-year BCA student and fresher Java Backend Developer who builds and deploys production-style systems with **Java 21, Spring Boot, Spring Security, REST APIs, PostgreSQL/MySQL, Redis and Docker**. Built a self-healing reliability platform and a multi-tenant fraud-detection API, both with JWT security, automated tests and CI/CD. Seeking an entry-level Java Backend / Software Developer role to write clean, tested, secure backend code.

EDUCATION

Bachelor of Computer Applications (BCA) | Dezyne École College, Ajmer 2024 - 2027

CGPA: 7.9/10 | Coursework: Data Structures & Algorithms, DBMS, Operating Systems, Computer Networks, Software Engineering

TECHNICAL SKILLS

Languages: Java, SQL, JavaScript, TypeScript, HTML, CSS
Backend: Spring Boot, Spring MVC, Spring Security, Spring Data JPA, Hibernate, REST APIs, JWT, Servlets, JSP, JDBC
Databases: PostgreSQL, MySQL, SQL Server, Redis, Flyway
Frontend: React, Tailwind CSS, Vite
Testing & DevOps: JUnit 5, Mockito, Testcontainers, Docker, Docker Compose, GitHub Actions, CodeQL, Prometheus, Grafana
Tools & Cloud: Git, GitHub, Maven, Postman, Swagger/OpenAPI, Linux, Render, Vercel, Microsoft Azure
Core Concepts: OOP, Data Structures & Algorithms, DBMS, MVC, Authentication & Authorization, Multi-tenancy

PROJECTS

RELAY AEGIS - Self-Healing Reliability Platform Oct 2026

Java 21 | Spring Boot 3 | React | TypeScript | PostgreSQL | Docker | GitHub Actions *GitHub*

- Built a platform that detects application failures, diagnoses the root cause from logs, health and container evidence, runs policy-checked Docker recovery and verifies health before it marks an incident resolved.
- In chaos tests, detected all 5 injected failures in 5-11 s and auto-recovered them in 15-34 s; without healing, 4 of 5 stayed down for over 90 s.
- Added code self-healing: scans GitHub repositories for hard-coded secrets and Docker risks, validates fixes in a disposable Docker sandbox (build, tests, security re-scan) and opens an approval-gated pull request; it never merges on its own.
- Engineered for safety and uptime: JWT with rotating refresh cookies, PostgreSQL lease-based leader election for high availability, a durable recovery journal, least-privilege Docker access, CodeQL scanning and 70+ automated test classes.

InvoiceGuard API - Invoice Fraud Detection Backend Sep 2026

Java 21 | Spring Boot 3 | Spring Security | PostgreSQL | Redis | Flyway | Docker *GitHub | Live API (Swagger)*

- Built a secure multi-tenant REST API that flags risky invoices before payment, with each organisation's data isolated by tenant.
- Designed an explainable 21-rule risk engine that catches exact and near-duplicate invoices, unusual amounts, unverified vendors and bank-detail changes, with optional Gemini AI summaries that never make the approval decision.
- Implemented JWT and refresh tokens, API keys, role-based access, Redis rate limiting, AES-256 encryption of bank details, idempotent requests, multi-level approvals, an audit trail and signed webhooks.
- Managed the schema with 6 Flyway migrations, tested with JUnit 5, Mockito and Testcontainers, and deployed on Render with Docker and GitHub Actions.

Smart Business AI Assistant - AI Business Management Platform May 2026 - Jul 2026

Spring Boot | React | MySQL | JWT | Docker *GitHub | Live Demo*

- Built an AI-powered platform that automates business workflows, with Spring Boot REST APIs secured by Spring Security and JWT on MySQL.
- Containerized with Docker and deployed on Render and Vercel; later used as the live test target for RELAY AEGIS chaos testing.

EXPERIENCE

Freelance Java Backend Developer | Self-employed, Remote Mar 2026 - Present

- Develop and deploy Java/Spring Boot business applications with REST APIs, MySQL databases and React interfaces for clients.
- Implement JWT authentication with Spring Security, containerize apps with Docker, deploy on Render and Vercel, and handle post-release fixes.
